

## **FLAKES OR CHUNKS IN YOUR VARNISH? HERE'S HOW TO REMOVE THEM WITHOUT HAVING TO THROW AWAY THE CONTAINER.**

If you have any flakes or chunks of varnish in your container, the easiest way to remove them is through a strainer. Just fill your measuring cup with the amount needed, and pour through a strainer into another cup (or container). The strainer will catch everything solid and you can just throw it out. Don't have a strainer? No problem. A great inside tip is to use a coffee filter. Just grab a large cup or container and tape a coffee filter to the rim. Then, slowly pour your varnish into the filter. A coffee filter takes time for liquid to pass through it, so pour a little at a time. This is a good trick because it will pick up anything that isn't pure liquid, and the end result is a perfect mix of varnish. These tips also work well if you have old gallons that have not been used in a long time. Remember, if you see any chunks of varnish on your print they will dry that way. So if you've ever encountered this problem grab a strainer and you're good to go.
